

Quest® Site Administrator for SharePoint

TAKE CONTROL OF YOUR SHAREPOINT ENVIRONMENT!

"Microsoft has experienced continued growth for SharePoint Portal Server showing 75 million users by 2005."

- Microsoft Worldwide SharePoint Conference, May 2006

Organizations are collaborating more than ever, using Microsoft® SharePoint®. Teams are creating their own Web sites, posting documents, creating event calendars, exchanging ideas (through discussion boards) and much more. With SharePoint, it's easy to do all of this, even without IT assistance. But as SharePoint grows more and more, business critical information (like financial documents, strategic plans, processes and procedures) is being posted on this unmanaged platform. As a stakeholder in your business, how are you going to manage the risk of critical business information being housed in an uncontrolled environment?

To begin managing this emerging platform, IT needs to understand the scope and state of the SharePoint installations. Being unaware gives rise to significant technical challenges, such as poor network performance, server storage issues, support backlogs, and most importantly, security breaches and non-compliant information. What's needed is a holistic view of SharePoint, that provides IT stakeholders with maximum control and ongoing SharePoint server and site management.

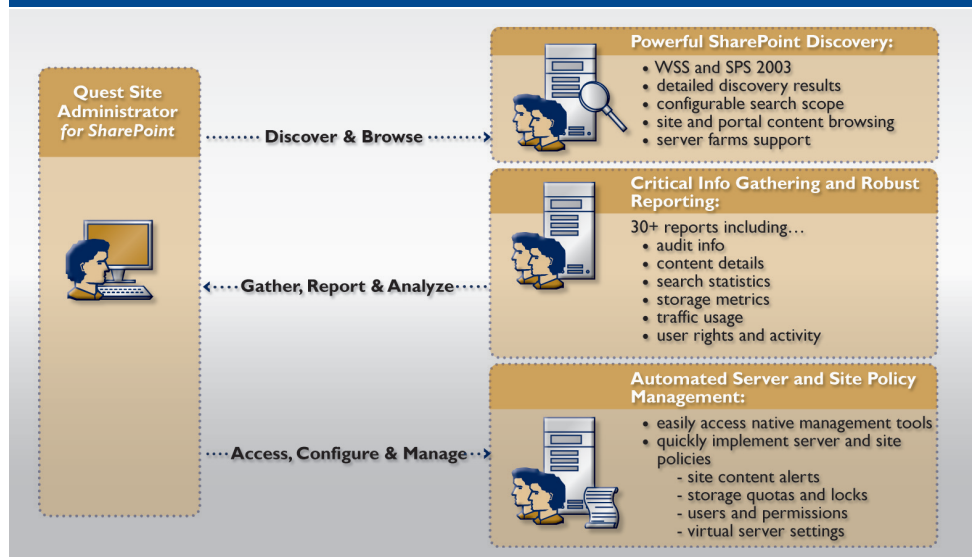

Take Control of Your SharePoint Environment

Quest® Site Administrator for SharePoint enables you to understand your entire SharePoint environment, with powerful auto discovery of SharePoint servers and sites, robust reporting of critical SharePoint information, and enterprise-wide server and site policy management. With no learning curve, and little start-up effort, knowing what's out there has never been easier!

A Powerful SharePoint Discovery Solution — Understand What You've Got

The powerful discovery wizard within Site Administrator enables you to quickly understand your SharePoint environment, by identifying all servers and sites across your network. The easy-to-use wizard provides at-a-glance discovery results, including the total number of SharePoint servers and sites that exist. The wizard discovers all types of SharePoint deployments, including Windows SharePoint Services (WSS), on a single server or Web farms running SharePoint Portal Server 2003. And to offer more flexibility, search scopes can be customized to include a domain, organization unit or individual computers.

TAKE CONTROL OF YOUR SHAREPOINT ENVIRONMENT!

System Requirements

Platform

- Intel x86

Operating System

- Windows XP SP2 or higher
- OR-
- Windows Server 2003 SP1 or higher

Additional Software & Services

- .Net Framework 1.1
- Internet Explorer 6.0 or higher
- SQL Server 2000 SP3 or higher (remote or local)
- OR-
- SQL Server 2005
- SQL Reporting Services

Easily Navigate Portals and Site Content — Explore your SharePoint Resources

Readily explore discovered SharePoint sites and site content, right from the enterprise management console of Site Administrator. Using the navigation tree, discovered sites and portal content can be displayed, allowing you to quickly and easily browse through all your SharePoint resources. Searching through the discovered content provides IT with insightful information about the SharePoint deployments within the enterprise and suggests actions that can be taken to manage the environment.

Robust Reporting — Get the Critical Information You Need to Make Decisions

Understanding the scope of your SharePoint environment helps you identify current issues to better prepare you for the growth of tomorrow. Avoid the challenges associated with inadequate network performance, insufficient storage space, inappropriate security permissions and support. With Site Administrator, you have access to over 30 reports that provide critical information on your SharePoint installations. Get the essential knowledge required to make informed decisions about your SharePoint environment:

- Audit information
- Content details
- Search statistics
- Storage metrics
- Traffic usage
- User activity

Simplified Access to SharePoint Management Pages — Central Administration is a Snap

Native management tools in SharePoint are cumbersome and time consuming to access, without knowing specific port numbers and site URLs. Site Administrator eliminates this burden by providing simplified access to SharePoint management pages. Central administration of SharePoint is easy with our built-in shortcuts, linking you to specific server and site management pages. Now you can easily and quickly change site settings and manage security.

Automated Server and Site Policy Management — It's a Mouse Click Away

Improve SharePoint management and increase efficiency by automatically implementing global server and site policies across your environment. With Site Administrator, you have the flexibility to easily create, edit, and copy server and site policy settings across your network. This automated policy management allows you to configure hundreds of SharePoint servers and thousands of sites in a matter of minutes – a task that would normally take hours to perform manually. Or if you choose, configure a single server or site with ease. Imagine being able to quickly set site content alerts, storage quotas and locks, users and permissions, content creation rules, self-service site creation and much more, across your entire network with a simple click of the mouse.
